

AI in Practice

Session 1

First Contact with AI

Participant Handout & Use Case Workbook

msg Romania

AI Adoption Initiative | Layer 1

Find. Build. Present. Your own AI use case.

YOUR MISSION FOR THIS COURSE

The goal

By the end of this course you will find, build and present ONE AI use case from your own daily work. Pick a real, recurring task -- ideally something from your testing work -- use AI on it across the sessions, and present what you learned.

What your final presentation must cover

1. The task you chose (and why it was worth it)
2. Your first attempt (the first prompt and what you got back)
3. What worked -- and what did NOT work for you
4. What you changed to make it better
5. The result, and what you would do next

The iteration loop -- run it on your use case

TRY -> Write a first prompt and run it.

OBSERVE -> What is good? What is wrong or missing?

ADJUST -> Add context, apply CRAFT, change the ask.

RETRY -> Run again, compare, keep improving.

WORKSHOP WORKSHEET

1. My Repetitive Task

Write the tedious task you shared during the icebreaker:

Task: _____

Why is it repetitive / boring? _____

2. My First Prompt (Exercise 1)

Write the exact prompt you typed:

Prompt: _____

Rate the result:

☐ Useful ☐ Partially useful ☐ Not useful

What was good? _____

What was wrong? _____

3. The CRAFT Framework

CRAFT = 5 elements that make any prompt better

C = Context: What is the situation? Who am I? What project?

R = Request: What exactly do I want the AI to produce?

A = Audience: Who will read or use this output?

F = Format: Bullet points? Table? Paragraph? Code?

T = Tone: Professional? Casual? Technical? Friendly?

4. My Improved Prompt (Exercise 2)

Write the improved version after applying CRAFT:

Improved prompt: _____

Which CRAFT elements did you add?

☐ C ☐ R ☐ A ☐ F ☐ T

Did the response improve?

☐ Significantly ☐ Somewhat ☐ Not really

MY USE CASE LOG (your final presentation is built from this)

Pick one recurring task -- ideally from your testing work -- and run the iteration loop on it. Log each attempt. By Session 2 you should have at least 2-3 attempts here.

My use case

Task / use case:

How often I do it:

Roughly how long it takes today:

Iteration attempts

Attempt 1

What I tried (prompt / approach):

Result -- what worked:

What did NOT work:

What I changed next:

Attempt 2

What I tried (prompt / approach):

Result -- what worked:

What did NOT work:

What I changed next:

Attempt 3

What I tried (prompt / approach):

Result -- what worked:

What did NOT work:

What I changed next:

Outcome so far

Best result I reached:

Time saved (estimate):

What I would try next:

FINAL PRESENTATION TEMPLATE (2-3 minutes, no slides needed)

Use this to prepare your end-of-course talk. Just walk the group through your iteration loop.

1. The task

Which recurring task did you pick, and why was it worth improving?

2. First attempt

What was your first prompt, and what did the AI give you?

3. What worked / what didn't

Be honest -- the failures are the most useful part for everyone.

4. What you changed

How did you iterate? (CRAFT elements, more context, a new approach.)

5. Result & next steps

Time saved, quality of output, and where you would take it next.

BETWEEN-SESSION ASSIGNMENTS

Assignment 1: Daily AI Challenge

Use AI for at least one real work task every day this week.
Keep a quick note of what you tried and whether it was useful.

Daily log:

Monday:

Tuesday:

Wednesday:

Thursday:

Friday:

Assignment 2: Read & Summarize

Read the prompt engineering article (link in follow-up email).
Then use AI to summarize it in 5 bullet points. Bring your summary to Session 2.

Summarization prompt to use

Summarize this article about prompt engineering in 5 bullet points aimed at a QA / software engineer who has never written a prompt before: [paste article text]

Assignment 3: Build Your Use Case

Pick a recurring testing task. Run the iteration loop on it (at least 2-3 attempts) and fill in your Use Case Log. This becomes the basis of your final presentation.

What is the task?

How often?

How could AI help?

Confidence Self-Assessment (rate 1-5)

1 = Not at all 2 = Slightly 3 = Somewhat 4 = Quite 5 = Very confident

1. How confident using AI tools for work?

2. How often do you currently use AI?

3. How well can you write effective prompts?

4. How comfortable evaluating AI output?

5. How likely to recommend AI to a colleague?

PROMPT LIBRARY (12 categories, 30+ prompts)

Adapt these prompts to your specific context, project, and role. The first categories are tailored for QA / testing.

1. Test Automation

Tests from acceptance criteria

You are an experienced QA automation engineer. Generate test cases for this user story. Cover: happy path, boundary values, negative cases and error handling. Output as a table: ID, title, preconditions, steps, expected result.

User story / acceptance criteria: "[Paste here]"

Generate automated tests

Write [JUnit 5 / pytest / Playwright] tests for this code. One test per scenario with clear names. Include valid input, invalid input, edge cases and null/empty handling. Add brief comments.

Code: "[Paste here]"

Manual steps -> automation

Convert these manual test steps into an automated [Selenium/Playwright] script in [language]. Use the Page Object pattern and stable locators.

Manual steps: "[Paste here]"

2. Test Data & Edge Cases

Generate test data

Generate 15 realistic test data rows for this input: [describe fields and constraints]. Include valid, boundary and invalid examples. Output as CSV. Flag which rows are negative cases.

Find edge cases

I am testing this function/feature: [describe]. List the edge cases and failure modes I might be missing, grouped by category, with a short reason for each.

3. Understanding Code

Explain a method

Explain what this method does in plain language:
1. Purpose 2. Input parameters 3. Step-by-step logic
4. Return value 5. Potential issues to test

[Paste method here]

4. Debugging

Diagnose a failing test

This test is failing/flaky:
[Paste test + error + stack trace]

Relevant code: [Paste code]

Help me: 1) Explain the failure 2) Likely cause 3) Fix 4) How to make it stable

5. Requirement Analysis

Identify gaps

You are an experienced business analyst. Analyze this requirement and identify: ambiguities, missing acceptance criteria, edge cases, and dependencies.

Requirement: "[Paste here]"

Format as a numbered list.

Convert to user stories

Convert this requirement into user stories:
As a [role], I want [feature] so that [benefit].
Acceptance Criteria: - [criterion]

Requirement: "[Paste here]"

6. Documentation

Process document

Document this process as a step-by-step guide for a new team member.
Include: purpose, prerequisites, steps, troubleshooting, outcome.

Process: "[Describe informally]"

7. Learning New Tech

Learning plan

I am a QA/test engineer. I need to learn [technology] in 2 weeks. Create:
1. Fundamentals (2-3 hours) 2. Key concepts
3. How it applies to testing 4. Practical exercise 5. Top 3 resources

8. Meeting Summaries

Summarize notes

Summarize these meeting notes into:
1. Key Decisions 2. Action Items (who, what, when)
3. Open Questions 4. Next Steps

Notes: "[Paste raw notes]"

9. Email Drafting

From bullet points

Write a professional email from me ([role]) to [recipient].
Tone: [professional/friendly/formal/urgent]
Points: - [point 1] - [point 2]
Keep under [X] sentences. Include call to action.

10. Knowledge Transfer

KT document

I am transitioning off a project. Structure a KT document:
Project: [name] My role: [description]
For each area: overview, how it works, common tasks,
known issues, key contacts, things I wish I knew earlier.

11. German Communication

Translate technical content

Translate this technical documentation English->German.
Do NOT translate: technical terms used in English in German IT
(Deployment, Sprint, Repository), brand names.

Text: "[Paste]"
List any ambiguous terms with alternatives.

12. Personal Productivity

Prioritize tasks

Prioritize these tasks using the Eisenhower Matrix:
[List tasks + deadlines]

Suggest a daily schedule for 5 days. Account for meetings,
morning energy, buffer time.

AI USE CASES BY ROLE (from msg Romania materials)

QA / Testing (start here)

Generate test cases from acceptance criteria | Write unit/integration/E2E tests | Turn manual steps into automation scripts | Generate test data & edge cases | Create Page Objects & locators | Explain & fix flaky tests | Coverage gap analysis | Gherkin / BDD scenarios from user stories

Developers, DevOps

Generate code snippets | Refactor code | Explain legacy code | Debug: 'explain why this fails' | Draft commit messages & PRs | Explain build errors | Generate SQL from text | Learn frameworks quickly | GitHub Copilot code completion

BC, PO, SM, PM, Support

Summarize meetings & extract actions | Stakeholder communication drafts | User story templates & acceptance criteria | Sprint goals from backlog | Retrospective questions | Risk simulation | Customer feedback analysis

All Roles

Email drafting | Meeting preparation | Learning new technologies | German-English translation | Brainstorming | Summarizing documents

Program Overview: 4 Sessions

Session 1 (Today!): First Contact with AI

Get comfortable, first prompts, CRAFT, the iteration loop, pick your use case.

Session 2: AI in Your Daily Work

Progress on your use case, prompt engineering patterns.

Session 3: AI for Testing & Code

Participant-led topics, AI Code Clinic, output critique.

Session 4: Sustaining AI Adoption

Final use case presentations, personal AI toolkit, next steps.

Learning Principle

Participant-Driven Learning

"Participants learn first, then teach back to the group."

Work on your use case between sessions, log your iterations, and present what you learned.
